Topic: Remainder and Factor Theorems

Name: _____

What am I learning today?

Warm-Up

Evaluate the following:

1) $f(x) = 2x^3 + 4x^2 - 8x - 16$

a) $f(6) = 2(6)^3 + 4(6)^2 - 8(6) - 16 = 512$

b) $f(-2) = 2(-2)^3 + 4(-2)^2 - 8(-2) - 16 = 0$

Divide using synthetic division.

2) $f(x) = 4x^3 - 2x^2 + x - 21$; $\boxed{x-3}$
 $x-3=0$
 $x=3$

$$\begin{array}{r|rrrr} 3 & 4 & -2 & 1 & -21 \\ & \downarrow & 12 & 30 & 93 \\ \hline & 4 & 10 & 31 & \boxed{72} \end{array}$$

$x^2 \quad x \quad c$

$f(3) = 72$

$$\begin{array}{r} 4x^2 + 10x + 31 + \frac{72}{x-3} \\ \hline x-3 \end{array}$$

Notes

The Remainder Theorem

The **Remainder** theorem can help us find the remainder of a polynomial without using synthetic division.

The **Remainder Theorem** states that the remainder of a polynomial $f(x)$ divided by $(x - c)$ is equal to $f(c)$.

Examples

Ex 1: Use synthetic division to find the remainder.

$f(x) = 7x^3 - 3x^2 + 6x - 5$; $\boxed{x-3}$
 $x-3=0$
 $x=3$

$$\begin{array}{r|rrrr} 3 & 7 & -3 & 6 & -5 \\ & \downarrow & 21 & 54 & 180 \\ \hline & 7 & 18 & 60 & \boxed{175} \end{array}$$

Using the remainder theorem we can now evaluate to find the remainder.

$f(3) = \underline{175}$ $7(3)^3 - 3(3)^2 + 6(3) - 5$

Ex 2: Use synthetic division and the remainder theorem to find the remainder of the polynomial.

$f(x) = 2x^4 + x^2 - 4x + 8$; $\boxed{x=-2}$ $f(-2) = 2(-2)^4 + (-2)^2 - 4(-2) + 8$

$$\begin{array}{r|rrrrr} -2 & 2 & 0 & 1 & -4 & 8 \\ & \downarrow & -4 & 8 & -18 & 44 \\ \hline & 2 & -4 & 9 & -22 & \boxed{52} \end{array}$$

$f(-2) = 52$

Review...Using the following polynomial:

$$f(x) = (x + 1)^2(x - 2)$$

$$\begin{aligned} x + 1 &= 0 \\ x &= -1 \\ x - 2 &= 0 \\ x &= 2 \end{aligned}$$

1. Find the zeros: $x = \underline{-1}$ $x = \underline{2}$

2. Multiply out the polynomial: $f(x) = x^3 - 3x - 2$

3. Do synthetic division (twice) w/your two zeros:

a.
$$\begin{array}{r|rrrr} -1 & 1 & 0 & -3 & -2 \\ & & 0 & -1 & 1 & 2 \\ \hline & 1 & -1 & -2 & 0 \end{array}$$

$f(-1) = 0$

b.
$$\begin{array}{r|rrrr} 2 & 1 & 0 & -3 & -2 \\ & & 2 & 4 & 2 \\ \hline & 1 & 2 & 1 & 0 \end{array}$$

$\therefore f(2) = 0$

4. What do you notice about your remainders?

Topic: Factor and Remainder Theorems

Date: _____

Notes
The Factor Theorem

RECALL: An **x-intercept** is where a function crosses the x axis.

X-INTERCEPT = zero = root

The **Factor Theorem** states that a polynomial $f(x)$ has a factor $(x - c)$ if and only if $f(c)=0$.

If an x-value is a zero of a function then we know that $f(x) = 0$.

Examples

Use the remainder theorem and synthetic division to determine whether the given value is a zero of the polynomial.

Ex 1. $f(x) = x^3 - x^2 - x - 2$; $x = 2$

$f(2) = (2)^3 - (2)^2 - (2) - 2$
 $= 0$

$$\begin{array}{r|rrrr} 2 & 1 & -1 & -1 & -2 \\ & \downarrow & 2 & 2 & 4 \\ \hline & 1 & 1 & 1 & 2 \end{array}$$

★ Yes, $x=2$ is a zero of the polynomial

Ex 2. $f(x) = 4x^3 - 5x^2 + 2x - 1$; $x = 3$

$$\begin{array}{r|rrrr} 3 & 4 & -5 & 2 & -1 \\ & \downarrow & 12 & 21 & 69 \\ \hline & 4 & 7 & 23 & 68 \end{array}$$

✦ No, $x=3$ is not a zero!

You Try

Use the remainder theorem and synthetic division to determine whether the given value is a zero of the polynomial.

1) $f(x) = 5x^3 - 3x^2 + 2x + 10$; $x = -1$
